INFRARED DETECTORS AND DETECTION MODULES – SELECTED LINE

We present VIGO most popular infrared detectors and integrated detection modules. These devices are suitable for both laboratory research as well as tests, prototyping, R&D stage and in a variety of MWIR and LWIR industrial applications.

Main features

- › High performance and reliability
- › Very good repeatability in mass production
- › Cost-effective solutions
- › Fast delivery

PVI-4-1 × 1-TO39-NW-36

2.4 – 4.5 μm HgCdTe ambient temperature, optically immersed photovoltaic detector

PVI-4-1 × 1-TO39-NW-36 is uncooled IR photovoltaic detector based on sophisticated HgCdTe heterostructure for the best performance and stability. The device is optimized for the maximum performance at 4 μm . Detector element is monolithically integrated with hyperhemispherical GaAs microlens in order to improve performance of the device. Reverse bias may significantly increase response speed and dynamic range. It also results in improved performance at high frequencies, but 1/f noise that appears in biased devices may reduce performance at low frequencies.

Spectral response ($T_a = 20^\circ\text{C}$, $V_b = 0$ mV)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$, $V_b = 0$ mV)

Parameter	Detector type PVI-4-1 × 1-TO39-NW-36
Active element material	epitaxial HgCdTe heterostructure
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	2.4±0.5
Peak wavelength λ_{peak} , μm	3.4±0.5
Optimum wavelength λ_{opt} , μm	4.0
Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm	4.5±0.3
Detectivity $D^*(\lambda_{\text{peak}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 4.0 \times 10^{10}$
Detectivity $D^*(\lambda_{\text{opt}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 3.0 \times 10^{10}$
Current responsivity $R_i(\lambda_{\text{peak}})$, A/W	≥ 2.0
Current responsivity $R_i(\lambda_{\text{opt}})$, A/W	≥ 1.0
Time constant τ , ns	≤ 150
Resistance R , Ω	≥ 600
Optical area A_o , mm×mm	1×1
Package	TO39
Acceptance angle Φ	~36°
Window	none

Features

- › Wide dynamic range
- › Convenient to use
- › Very small size
- › Cost-effective solution
- › Quantity discounted price
- › Fast delivery

Applications

- › Gas detection, monitoring and analysis (CH₄, C₂H₂, CH₂O, HCl, NH₃, SO₂, C₂H₆)
- › Breath analysis
- › Explosion prevention
- › Flue gas denitrification
- › Emission control (exhaust fumes, greenhouse gases)

Mechanical layout, mm

Bottom view

Parameter	Value
Immersion microlens shape	hyperhemisphere
Optical area A_o , mm×mm	1×1
R, mm	0.8
A, mm	2.4±0.2

Function	Pin number
Detector	1, 2
Reverse bias (optional)	1(-), 2(+)
Chassis ground	3

Φ – acceptance angle

R – hyperhemisphere microlens radius

A – distance from the bottom of hyperhemisphere microlens to the focal plane

Precautions for use and storage

- › Standard ohmmeter may overbias and damage the detector. Bias of 10 mV can be used for resistance measurements.
- › Operation in 10% to 80% humidity and -20°C to 30°C ambient temperature.
- › Beam power limitations for optically immersed detector:
 - › irradiance with CW or single pulse longer than 1 μ s irradiance on the apparent optical active area must not exceed 2.5 W/cm²,
 - › irradiance of the pulse shorter than 1 μ s must not exceed 10 kW/cm².
- › Storage in dark place with 10% to 90% humidity and -20°C to 50°C ambient temperature.

PVI-5-1 × 1-TO39-NW-36

2.4 – 5.5 μm HgCdTe ambient temperature, optically immersed photovoltaic detector

PVI-5-1 × 1-TO39-NW-36 is uncooled IR photovoltaic detector based on sophisticated HgCdTe heterostructure for the best performance and stability. The device is optimized for the maximum performance at 5 μm . Detector element is monolithically integrated with hyperhemispherical GaAs microlens in order to improve performance of the device. Reverse bias may significantly increase response speed and dynamic range. It also results in improved performance at high frequencies, but 1/f noise that appears in biased devices may reduce performance at low frequencies.

Spectral response ($T_a = 20^\circ\text{C}$, $V_b = 0$ mV)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$, $V_b = 0$ mV)

Parameter	Detector type PVI-5-1 × 1-TO39-NW-36
Active element material	epitaxial HgCdTe heterostructure
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	2.4±0.5
Peak wavelength λ_{peak} , μm	4.2±0.5
Optimum wavelength λ_{opt} , μm	5.0
Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm	5.5±0.3
Detectivity $D^*(\lambda_{\text{peak}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 3.0 \times 10^{10}$
Detectivity $D^*(\lambda_{\text{opt}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 1.0 \times 10^{10}$
Current responsivity $R_i(\lambda_{\text{peak}})$, A/W	≥ 2.0
Current responsivity $R_i(\lambda_{\text{opt}})$, A/W	≥ 1.0
Time constant τ , ns	≤ 150
Resistance R, Ω	≥ 100
Optical area A_{opt} , mm×mm	1×1
Package	TO39
Acceptance angle Φ	~36°
Window	none

Features

- › Wide dynamic range
- › Convenient to use
- › Very small size
- › Cost-effective solution
- › Quantity discounted price
- › Fast delivery

Applications

- › Contactless temperature measurements (railway transport, industrial and laboratory processes monitoring)
- › Flame and explosion detection
- › Threat warning systems
- › Gas detection, monitoring and analysis (CO, CO₂, NO_x)
- › Breath analysis
- › Solids analysis
- › Leakage control in gas pipelines
- › Combustion process control

Mechanical layout, mm

Bottom view

Parameter	Value
Immersion microlens shape	hyperhemisphere
Optical area A_o , mm×mm	1×1

PVI-2TE-4-I × I-TO8-wAl₂O₃-36

2.4 – 4.3 μm HgCdTe two-stage thermoelectrically cooled, optically immersed photovoltaic detector

PVI-2TE-4-I × I-TO8-wAl₂O₃-36 is two-stage thermoelectrically cooled IR photovoltaic detector based on sophisticated HgCdTe heterostructure for the best performance and stability. The device is optimized for the maximum performance at 4 μm . Detector element is monolithically integrated with hyperhemispherical GaAs microlens in order to improve performance of the device. Reverse bias may significantly increase response speed and dynamic range. It also results in improved performance at high frequencies, but 1/f noise that appears in biased devices may reduce performance at low frequencies. 3° wedged sapphire (wAl₂O₃) window prevents unwanted interference effects.

Spectral response ($T_a = 20^\circ\text{C}$, $V_b = 0$ mV)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$, $V_b = 0$ mV)

Parameter	Detector type PVI-2TE-4-I × I-TO8-wAl ₂ O ₃ -36
Active element material	epitaxial HgCdTe heterostructure
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	2.4 \pm 0.5
Peak wavelength λ_{peak} , μm	3.5 \pm 0.5
Optimum wavelength λ_{opt} , μm	4.0
Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm	4.3 \pm 0.3
Detectivity $D^*(\lambda_{\text{peak}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 4.0 \times 10^{11}$
Detectivity $D^*(\lambda_{\text{opt}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 3.0 \times 10^{11}$
Current responsivity $R_i(\lambda_{\text{peak}})$, A/W	≥ 2.0
Current responsivity $R_i(\lambda_{\text{opt}})$, A/W	≥ 1.3
Time constant τ , ns	≤ 100
Resistance R, Ω	≥ 20000
Active element temperature T_{det} , K	~ 230
Optical area A_{opt} , mm \times mm	1 \times 1
Package	TO8
Acceptance angle Φ	$\sim 36^\circ$
Window	wAl ₂ O ₃

Features

- › High performance
- › D* better by one order of magnitude compared with the same type uncooled detector
- › Wide dynamic range
- › Quantity discounted price
- › Fast delivery

Applications

- › Gas detection, monitoring and analysis (CH₄, C₂H₂, CH₂O, HCl, NH₃, SO₂, C₂H₆)
- › Breath analysis
- › Explosion prevention
- › Flue gas denitrification
- › Emission control (exhaust fumes, greenhouse gases)

Two-stage thermoelectric cooler parameters

Parameter	Value
T_{det} , K	~ 230
V_{max} , V	1.3
I_{max} , A	1.2
Q_{max} , W	0.36

Thermistor characteristics

Spectral transmission of wAl₂O₃ window (typical example)

Mechanical layout, mm

Parameter	Value
Immersion microlens shape	hyperhemisphere
Optical area A_{opt} , mm×mm	1×1
R, mm	0.8
A, mm	3.2±0.3

Φ – acceptance angle

R – hyperhemisphere microlens radius

A – distance from the bottom of the 2TE-TO8 header to the focal plane

Function	Pin number
Detector	1, 3
Reverse bias (optional)	1(-), 3(+)
Thermistor	7, 9
TE cooler supply	2(+), 8(-)
Chassis ground	11
Not used	4, 5, 6, 10, 12

Precautions for use and storage

- › Standard ohmmeter may overbias and damage the detector. Bias of 10 mV can be used for resistance measurements.
- › Heatsink with thermal resistance of ~2 K/W is necessary to dissipate heat generated by 2TE cooler.
- › Operation in 10% to 80% humidity and -20°C to 30°C ambient temperature.
- › Beam power limitations for optically immersed detector:
 - › irradiance with CW or single pulse longer than 1 μ s irradiance on the apparent optical active area must not exceed 2.5 W/cm²,
 - › irradiance of the pulse shorter than 1 μ s must not exceed 10 kW/cm².
- › Storage in dark place with 10% to 90% humidity and -20°C to 50°C ambient temperature.

PVI-2TE-5-I × I-TO8-wAl₂O₃-36

2.9 – 5.5 μm HgCdTe two-stage thermoelectrically cooled, optically immersed photovoltaic detector

PVI-2TE-5-I × I-TO8-wAl₂O₃-36 is two-stage thermoelectrically cooled IR photovoltaic detector based on sophisticated HgCdTe heterostructure for the best performance and stability. The device is optimized for the maximum performance at 5 μm. Detector element is monolithically integrated with hyperhemispherical GaAs microlens in order to improve performance of the device. Reverse bias may significantly increase response speed and dynamic range. It also results in improved performance at high frequencies, but 1/f noise that appears in biased devices may reduce performance at low frequencies. 3° wedged sapphire (wAl₂O₃) window prevents unwanted interference effects.

Spectral response ($T_a = 20^\circ\text{C}$, $V_b = 0\text{ mV}$)

PVI-2TE-6-I × I-TO8-wZnSeAR-36

3.0 – 6.7 μm HgCdTe two-stage thermoelectrically cooled, optically immersed photovoltaic detector

PVI-2TE-6-I × I-TO8-wZnSeAR-36 is two-stage thermoelectrically cooled IR photovoltaic detector based on sophisticated HgCdTe heterostructure for the best performance and stability. The device is optimized for the maximum performance at 6 μm . Detector element is monolithically integrated with hyperhemispherical GaAs microlens in order to improve performance of the device. Reverse bias may significantly increase response speed and dynamic range. 3° wedged zinc selenide anti-reflection coated (wZnSeAR) window prevents unwanted interference effects.

Spectral response ($T_a = 20^\circ\text{C}$, $V_b = 0$ mV)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$, $V_b = 0$ mV)

Parameter	Detector type PVI-2TE-6-I × I-TO8-wZnSeAR-36
Active element material	epitaxial HgCdTe heterostructure
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	3.0 \pm 1.0
Peak wavelength λ_{peak} , μm	5.2 \pm 0.5
Optimum wavelength λ_{opt} , μm	6.0
Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm	6.7 \pm 0.3
Detectivity $D^*(\lambda_{\text{peak}})$, $\text{cm}^2\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 7.0 \times 10^{10}$
Detectivity $D^*(\lambda_{\text{opt}})$, $\text{cm}^2\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 4.0 \times 10^{10}$
Current responsivity $R_i(\lambda_{\text{peak}})$, A/W	≥ 2.7
Current responsivity $R_i(\lambda_{\text{opt}})$, A/W	≥ 1.5
Time constant τ , ns	≤ 50
Resistance R , Ω	≥ 200
Active element temperature T_{det} , K	~ 230
Optical area A_{opt} , mm \times mm	1 \times 1
Package	TO8
Acceptance angle Φ	$\sim 36^\circ$
Window	wZnSeAR

Features

- › High performance
- › Wide dynamic range
- › Versatility
- › Quantity discounted price
- › Fast delivery

Applications

- › Applications
- › Gas detection, monitoring and analysis (CO , CO_2 , NH_3 , NO_x)
- › Flue gas denitrification
- › Fuel combustion monitoring at power plants and other industrial facilities
- › Contactless temperature measurements

Precautions for use and storage

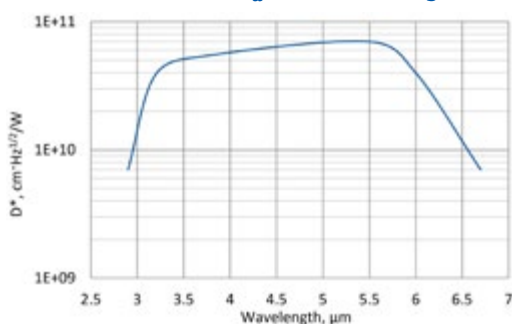

- › Standard ohmmeter may overbias and damage the detector. Bias of 10 mV can be used for resistance measurements.
- › Heatsink with thermal resistance of ~ 1 K/W is necessary to dissipate heat generated by 4TE cooler.
- › Operation in 10% to 80% humidity and -20°C to 30°C ambient temperature.
- › Beam power limitations for optically immersed detector:
 - › irradiance with CW or single pulse longer than $1 \mu\text{s}$ irradiance on the apparent optical active area must not exceed $2.5 \text{ W}/\text{cm}^2$,
 - › irradiance of the pulse shorter than $1 \mu\text{s}$ must not exceed $10 \text{ kW}/\text{cm}^2$.
- › Storage in dark place with 10% to 90% humidity and -20°C to 50°C ambient temperature.

PVM-10.6-1 × 1-TO39-NW-90

2 – 12 μm HgCdTe ambient temperature photovoltaic multiple junction detector

PVM-10.6-1x1-TO39-NW-90 is uncooled IR photovoltaic multiple junction detector based on sophisticated HgCdTe heterostructure for the best performance and stability. The device is designed for the maximum performance at 10.6 μm and especially useful as a large active area detector to detect CW and low frequency modulated radiation.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$, $V_b = 0 \text{ mV}$)

Parameter	Detector type PVM-10.6-1 × 1-TO39-NW-90
Active element material	epitaxial HgCdTe heterostructure
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	≤ 2.0
Peak wavelength λ_{peak} , μm	8.5 ± 1.5
Optimum wavelength λ_{opt} , μm	10.6
Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm	≥ 12.0
Detectivity $D^*(\lambda_{\text{peak}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 2.0 \times 10^7$
Detectivity $D^*(\lambda_{\text{opt}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 1.0 \times 10^7$
Current responsivity $R_i(\lambda_{\text{peak}})$, A/W	≥ 0.004
Current responsivity $R_i(\lambda_{\text{opt}})$, A/W	≥ 0.002
Time constant τ , ns	≤ 1.5
Resistance R , Ω	≥ 30
Active area A , mm \times mm	1 \times 1
Package	TO39
Acceptance angle Φ	$\sim 90^\circ$
Window	none

Features

- › Wide spectral range from 2 to 12 μm
- › Large active area 1 \times 1 mm²
- › No bias required
- › No flicker noise
- › Short time constant $\leq 1.5 \text{ ns}$
- › Operation from DC to high frequency
- › Sensitive to IR radiation polarisation
- › Very small size
- › Convenient to use
- › Versatility
- › Cost-effective solution
- › Quantity discounted price
- › Fast delivery

Applications

- › CO₂ laser (10.6 μm) measurements
- › Laser power monitoring and control
- › Laser beam profiling and positioning
- › Laser calibration
- › Dentistry

PEM-10.6-2×2-PEM-SMA-wZnSeAR-48

2 – 12 μm HgCdTe ambient temperature photoelectromagnetic detector

PEM-10.6-2×2-PEM-SMA-wZnSeAR-48 is uncooled IR photovoltaic multiple junction HgCdTe detector based on photo-electromagnetic effect in the semiconductor – spatial separation of optically generated electrons and holes in the magnetic field. This device is designed for the maximum performance at 10.6 μm and especially useful as a large active area detector to detect CW and low frequency modulated radiation. This device is mounted in specialized package with incorporated magnetic circuit inside and SMA signal output connector. 3° wedged zinc selenide anti-reflection coated window prevents unwanted interference effects and protects against pollution.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

PCI-3TE-12-1 × 1-TO8-wZnSeAR-36

2 – 14 μm HgCdTe three-stage thermoelectrically cooled, optically immersed photoconductive detector

PCI-3TE-12-1 × 1-TO8-wZnSeAR-36 is a three-stage thermoelectrically cooled IR photoconductor, based on sophisticated HgCdTe heterostructure for the best performance and stability. The device is optimized for the maximum performance at 12 μm . Detector element is monolithically integrated with hyperhemispherical GaAs microlens in order to improve performance of the device. Photoconductive detector should operate in optimum bias voltage and current readout mode. Performance at low frequencies is reduced due to 1/f noise. 3° wedged zinc selenide anti-reflection coated (wZnSeAR) window prevents unwanted interference effects.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Detector type PCI-3TE-12-1 × 1-TO8-wZnSeAR-36
Active element material	epitaxial HgCdTe heterostructure
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	≤ 2.0
Peak wavelength λ_{peak} , μm	10.0 ± 0.2
Optimum wavelength λ_{opt} , μm	12.0
Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm	14.0 ± 0.2
Detectivity $D^*(\lambda_{\text{peak}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 1.6 \times 10^9$
Detectivity $D^*(\lambda_{\text{opt}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 9.0 \times 10^8$
Current responsivity $R_i(\lambda_{\text{peak}})$, A/W	≥ 0.11
Current responsivity $R_i(\lambda_{\text{opt}})$, A/W	≥ 0.07
Time constant τ , ns	≤ 5
Resistance R, Ω	≤ 300
Bias voltage Vb, V	≤ 1.8
1/f noise corner frequency f_c , kHz	≤ 20
Active element temperature T_{det} , K	~ 210
Optical area A_o , mm \times mm	1 \times 1
Package	TO8
Acceptance angle Φ	$\sim 36^\circ$
Window	wZnSeAR

Features

- › Wide spectral range from 1 to 14 μm
- › High responsivity
- › Large dynamic range
- › Excellent long term stability and reliability
- › Quantity discounted price
- › Fast delivery

Applications

- › FTIR spectroscopy and spectrometry

Detectivity $D^*(\lambda_{\text{peak}})$, $\text{cm}^2 \cdot \text{Hz}^{1/2} / \text{W}$	$\geq 5.0 \times 10^7$
Detectivity $D^*(\lambda_{\text{opt}})$, $\text{cm}^2 \cdot \text{Hz}^{1/2} / \text{W}$	$\geq 4.0 \times 10^7$
Output noise density v_n (averaged over 1 MHz to f_n), $\text{nV} / \text{Hz}^{1/2}$	≤ 380
Electrical parameters	
Voltage responsivity $R_v(\lambda_{\text{peak}})$, V/W	$\geq 1.6 \times 10^2$
Voltage responsivity $R_v(\lambda_{\text{opt}})$, V/W	$\geq 1.0 \times 10^2$
Low cut-off frequency f_{lo} , Hz	DC
High cut-off frequency f_{hi} , Hz	$\geq 70\text{M}$
Output impedance R_{out} , Ω	50
Output voltage swing V_{out} , V	± 2 ($R_L = 1 \text{ M}\Omega$)
Output voltage offset V_{off} , mV	max ± 20
Power supply voltage V_{sup} , V	+5
DC monitor (approx. 0 V offset)	
Voltage responsivity $R_v(\lambda_{\text{peak}})$, V/W	$\geq 3.6 \times 10^1$
Voltage responsivity $R_v(\lambda_{\text{opt}})$, V/W	$\geq 2.4 \times 10^1$
Low cut-off frequency f_{lo} , Hz	DC
High cut-off frequency f_{hi} , Hz	150k
Other information	
Active element material	epitaxial HgCdTe heterostructure
Active area A, mm \times mm	1 \times 1
Window	wedged zinc selenide AR coated (wZnSeAR)
Acceptance angle Φ	$\sim 70^\circ$
Ambient operating temperature T_a , $^\circ\text{C}$	10 to 30
Signal output socket	SMA
DC monitor socket	SMA
Power supply socket	DC 2.5/5.5
Mounting hole	M4
Fan	yes

¹⁾ R_L – load resistance

Features

- › Integrated TEC controller and fan
- › Single power supply
- › DC monitor
- › Sensitive to IR radiation polarisation
- › Optimised for effective heat dissipation
- › Compatible with optical accessories
- › Cost effective OEM version available
- › Universal and flexible
- › Quantity discounted price
- › Fast delivery

Applications

- › Gas detection, monitoring and analysis
- › CO₂ laser (10.6 μm) measurements
- › Laser power monitoring and control
- › Laser beam profiling and positioning
- › Laser calibration

Mechanical layout, mm

Spectral transmission of wZnSeAR window (typical example)

Included accessories

- › 2 × SMA-BNC cables + AC adaptor

Dedicated accessories

- › OTA optical threaded adapter
- › DRB-2 base mounting system

UM-I-10.6

2 – 12 μm and DC – 100 MHz HgCdTe universal IR detection module with optically immersed photovoltaic multiple junction detector

UM-I-10.6 is universal „all-in-one” IR detection module. Thermoelectrically cooled, optically immersed photovoltaic detector, based on HgCdTe heterostructure, is integrated with transimpedance, DC coupled preamplifier, a fan and a thermoelectric cooler controller in a compact housing. 3° wedged zinc selenide anti-reflection coated window prevents unwanted interference effects. UM-I-10.6 detection module is very convenient and user-friendly device, thus can be easily used in a variety of LWIR applications.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Typical value
Optical characteristics	
Cut-on wavelength $\lambda_{\text{cut-on}}(10\%)$, μm	≤ 2.0
Peak wavelength λ_{peak} , μm	8.5 ± 1.5
Optimum wavelength λ_{opt} , μm	10.6
Cut-off wavelength $\lambda_{\text{cut-off}}(10\%)$, μm	≥ 12.0
Detectivity $D^*(\lambda_{\text{peak}})$, $\text{cm} \cdot \text{Hz}^{1/2} / \text{W}$	$\geq 5.5 \times 10^8$
Detectivity $D^*(\lambda_{\text{opt}})$, $\text{cm} \cdot \text{Hz}^{1/2} / \text{W}$	$\geq 3.7 \times 10^8$
Output noise density v_n (averaged over 1 MHz to f_{hi}), $\text{nV} / \text{Hz}^{1/2}$	≤ 330
Electrical parameters	
Voltage responsivity $R_v(\lambda_{\text{peak}})$, V / W	$\geq 9.7 \times 10^2$
Voltage responsivity $R_v(\lambda_{\text{opt}})$, V / W	$\geq 6.5 \times 10^2$
Low cut-off frequency f_{lo} , Hz	DC
High cut-off frequency f_{hi} , Hz	$\geq 100\text{M}$
Output impedance R_{out} , Ω	50
Output voltage swing V_{out} , V	$\pm 1 (R_L = 50 \Omega^*)$
Output voltage offset V_{off} , mV	max ± 20
Power supply voltage V_{sup} , V	+5
DC monitor (approx. 0 V offset)	
Voltage responsivity $R_v(\lambda_{\text{peak}})$, V / W	$\geq 2.2 \times 10^2$
Voltage responsivity $R_v(\lambda_{\text{opt}})$, V / W	$\geq 1.5 \times 10^2$
Low cut-off frequency f_{lo} , Hz	DC
High cut-off frequency f_{hi} , Hz	150k
Other information	
Active element material	epitaxial HgCdTe heterostructure
Optical area A_{opt} , $\text{mm} \times \text{mm}$	1x1
Window	wedged zinc selenide AR coated (wZnSeAR)
Acceptance angle Φ	$\sim 36^\circ$
Ambient operating temperature T_a , $^\circ\text{C}$	10 to 30
Signal output socket	SMA
DC monitor socket	SMA
Power supply socket	DC 2.5/5.5
Mounting hole	M4
Fan	yes

microM-10.6

2 – 12 μm and DC – 10 MHz HgCdTe micro-size IR detection module with photovoltaic multiple junction detector

microM-10.6 is a micro-size IR detection module. Uncooled photovoltaic multiple junction detector, based on HgCdTe heterostructure, is integrated with transimpedance, DC coupled preamplifier. It is easy to assembly in space limited measuring systems of LWIR applications.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Typical value
Optical parameters	
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	≤ 2.0
Peak wavelength λ_{peak} , μm	8.0 ± 1.5
Optimum wavelength λ_{opt} , μm	10.6
Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm	≥ 12.0
Detectivity $D^*(\lambda_{\text{peak}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 1.5 \times 10^7$
Detectivity $D^*(\lambda_{\text{opt}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 5.0 \times 10^6$
Output noise density v_n (100 kHz), $\mu\text{V}/\text{Hz}^{1/2}$	≤ 1
Electrical parameters	
Voltage responsivity $R_v(\lambda_{\text{peak}})$, V/W	$\geq 1.2 \times 10^2$
Voltage responsivity $R_v(\lambda_{\text{opt}})$, V/W	$\geq 5.0 \times 10^1$
Low cut-off frequency f_{lo} , Hz	DC
High cut-off frequency f_{hi} , Hz	$\geq 10\text{M}$
Output impedance R_{out} , Ω	50
Output voltage swing V_{out} , V	± 1 ($R_L = 50 \Omega$)
Output voltage offset V_{off} , mV	max ± 20
Power supply voltage V_{sup} , V	+9
Other information	
Active element material	epitaxial HgCdTe heterostructure
Active area A, mm \times mm	1 \times 1
Window	none
Acceptance angle Φ	$\sim 85^\circ$
Ambient operating temperature T_a , $^\circ\text{C}$	10 to 30
Signal output plug	SMA
Power supply plug	03T-JWPF-VSLE-S (male)
Mounting hole	none
Fan	none

^{*)} R_L – load resistance

Features

- › Very small size
- › Convenient to use
- › Versatility
- › Sensitive to IR radiation polarisation
- › Cost effective OEM version available
- › Quantity discounted price
- › Fast delivery

Applications

- › Gas detection, monitoring and analysis
- › CO₂ laser (10.6 μm) measurements
- › Laser power monitoring and control

- › MH-1 module's holder
- › DRB-2 base mounting system

LabM-I-6

3.0 – 7.5 μm and over 200 MHz HgCdTe programmable, laboratory IR detection module with optically immersed photovoltaic detector

LabM-I-6 is a laboratory IR detection module with optically immersed photovoltaic detector based on HgCdTe heterostructure, integrated with transimpedance, programmable preamplifier. 3° wedged zinc selenide anti-reflection coated window prevents unwanted interference effects. For proper operation programmable „smart” VIGO thermoelectric cooler controller PTCC-01 (sold separately) and Smart Manager Software (freeware) are required. LabM I 6 module comes complete with PTCC-01 and Smart Manager is the best solution for prototyping and R&D stage in a variety of MWIR applications. This set provides flexible approach to different needs of system designers.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$, default module settings)

Parameter	Typical value
Optical parameters	
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	3.0 \pm 1.0
Peak wavelength λ_{peak} , μm	5.5 \pm 0.5
Optimum wavelength λ_{opt} , μm	6.0
Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm	7.5 \pm 0.5
Detectivity $D^*(\lambda_{\text{peak}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 8.1 \times 10^9$
Detectivity $D^*(\lambda_{\text{opt}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 7.2 \times 10^9$
Output noise density v_n (10 kHz), $\mu\text{V}/\text{Hz}^{1/2}$	≤ 350
Electrical parameters	
Voltage responsivity $R_v(\lambda_{\text{peak}})$, V/W	$\geq 2.3 \times 10^4$
Voltage responsivity $R_v(\lambda_{\text{opt}})$, V/W	$\geq 2.0 \times 10^4$
Low cut-off frequency f_{lo} , Hz	10
High cut-off frequency f_{hi} , Hz	$\geq 200\text{M}$ (adjustable)
Output impedance R_{out} , Ω	50
Output voltage swing V_{out} , V	± 1 ($R_L = 1 \text{ M}\Omega$)
Output voltage offset V_{off} , mV	max ± 20
Other information	
Active element material	epitaxial HgCdTe heterostructure
Optical area A_o , mm \times mm	1 \times 1
Window	wedged zinc selenide AR coated (wZnSeAR)
Acceptance angle Φ	$\sim 36^\circ$
Ambient operating temperature T_a , $^\circ\text{C}$	10 to 30
Signal output socket	SMA
Power supply and TEC control socket	LEMO (female) ECG.0B.309.CLN
Mounting hole	M4
Fan	yes

^{*)} R_L – load resistance

Features

- › Very high performance and reliability
- › DC offset compensation
- › Compatible with optical accessories
- › Versatility and flexibility
- › Quantity discounted price
- › Fast delivery

Parameters configurable by the user

- › Output voltage offset
- › Gain (in 40 dB range)
- › Bandwidth (1.5 MHz/15 MHz/200 MHz)
- › Coupling AC/DC
- › Detector's parameters (temperature, reverse bias etc.)

Applications

- › MWIR gas detection, monitoring and analysis
- › Flue gas denitrification
- › Fuel combustion monitoring at power plants and other industrial facilities
- › Breath analysis
- › Explosion prevention
- › Emission control (exhaust fumes, greenhouse gases)
- › Contactless temperature measurements

INFRARED DETECTORS AND MODULES – CONFIGURABLE LINE

VIGO offers various types of infrared detectors based on Mercury Cadmium Telluride, Indium Arsenide and Indium Arsenide Antimonide featuring different parameters.

Main features

- › Optimized at any wavelength from 2 – 14 μm spectral range
- › With or without immersion technology
- › Uncooled or thermoelectrically cooled
- › Different sizes of active/optical area
- › Different packages
- › Different infrared windows
- › Different acceptance angle
- › Wide range of dedicated preamplifiers and accessories

How to choose an infrared detector?

For making a detector selection, following points should be taken into consideration:

- › wavelength or wavelength range,
- › detectivity,
- › speed of response.

VIGO detectors are optimized for various wavelengths. Depending on the required parameters a proper detector type should be selected.

Detector series	Spectral response range, μm	Features
HgCdTe (MCT) photoconductive detectors		<ul style="list-style-type: none"> › Broad 1 – 16 μm spectral range › Active area from $25 \times 25 \mu\text{m}^2$ to $4 \times 4 \text{mm}^2$ › High detectivity › Low speed › Long lifetime and MTBF › Stability and reliability › 1/f noise › Uncooled and TE cooled › Immersion microlens technology available
HgCdTe (MCT) photovoltaic detectors		<ul style="list-style-type: none"> › Near BLIP detection in 3 – 6 μm range › < 10x gap to BLIP for > 7 μm › No bias required › No 1/f noise › Bandwidth: <ul style="list-style-type: none"> › tens of MHz (without reverse bias) › $\geq 1\text{GHz}$ (with reverse bias) › LWIR devices limited to small areas › Uncooled and TE cooled › Immersion microlens technology available

Detector code

Different information such as detector type, optical immersion, number of stages thermoelectric cooler, the wavelength a detector is optimized for, size of active/optical area, package type, window type and acceptance angle combine to create VIGO System's detector code.

Detector type	Immersion	—	Cooling	—	Optimal wavelength	—	Active/optical area	—	Package	—	Window	—	Acceptance angle
---------------	-----------	---	---------	---	--------------------	---	---------------------	---	---------	---	--------	---	------------------

Please see particular detector series datasheets to get available options of each detector type.

How to choose a preamplifier?

Infrared detection module integrates infrared photodetector and preamplifier in a common package. The integration makes detectors less vulnerable to:

- › over-bias,
- › electrostatic discharges,
- › electromagnetic interferences,
- › other environmental exposures.

Additional advantages of integration are: improved high-frequency performance, output signal standardization, miniaturization and cost reduction. The broad line of transimpedance preamplifiers is especially designed for integration with VIGO IR detectors.

Main feature	Phoyo	Preamplifier type	Detector type	Low cut-off frequency f_{lc} , Hz	High cut-off frequency f_{hp} , Hz	Transimpedance K_t , V/A	Radiator / fan	TEC controller	Mounting hole

Small		SIP-TO39	TE cooled PC/ PCI TE cooled PV/PVI TE cooled PVA/PVIA TE cooled PVM/PVMI	DC, 10, 100, 1k, 10k	100k, 1M, 10M, 100M, 250M	up to 100k (tunable)	not necessary	not necessary	none

To obtain the most optimal parameters of integrated module each preamplifier is individually matched to the selected detector. The parameters of integrated set will be known after final evaluation (matching, adjustment and final tests).

If you need any assistance in selecting VIGO product appropriate for your application, please contact VIGO Technical Support Team: techsupport@vigo.com.pl

PC series

1 – 12 μm HgCdTe ambient temperature photoconductive detectors

PC series features uncooled IR photoconductive detectors based on sophisticated HgCdTe heterostructures for the best performance and stability. The devices are optimized for the maximum performance at λ_{opt} . The devices should operate in optimum bias voltage and current readout mode. Performance at low frequencies is reduced due to 1/f noise. The 1/f noise corner frequency increases with the cut-off wavelength.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

PCI-3TE series

I – 15 μm HgCdTe three-stage thermoelectrically cooled, optically immersed photoconductive detectors

PCI-3TE series features three-stage thermoelectrically cooled IR photoconductive detectors based on sophisticated HgCdTe heterostructures for the best performance and stability, optically immersed in order to improve parameters of the devices. The detectors are optimized for the maximum performance at λ_{opt} . Cut-on wavelength is limited by GaAs transmittance ($\sim 0.9 \mu\text{m}$). The devices should operate in optimum bias voltage and current readout mode. Performance at low frequencies is reduced due to 1/f noise. The 1/f noise corner frequency increases with the cut-off wavelength. 3° wedged zinc selenide anti-reflection coated (wZnSeAR) window prevents unwanted interference effects.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$)

PVI-2TE series

2 – 12 μm HgCdTe two-stage thermoelectrically cooled, optically immersed photovoltaic detectors

PVI-2TE series features two-stage thermoelectrically cooled IR photovoltaic detectors based on sophisticated HgCdTe heterostructures for the best performance and stability, optically immersed in order to improve parameters of the devices. The detectors are optimized for the maximum performance at λ_{opt} . Cut-on wavelength can be optimized upon request. Reverse bias may significantly increase speed of response and dynamic range. It results also in improved performance at high frequencies, but 1/f noise that appears in biased devices may reduce performance at low frequencies. 3° wedged sapphire (wAl_2O_3) or zinc selenide anti-reflection coated (wZnSeAR) window prevents unwanted interference effects.

Spectral response ($T_a = 20^\circ\text{C}, V_b = 0 \text{ mV}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}, V_b = 0 \text{ V}$)

AIP series

AIP is a new generation of transimpedance, AC or DC coupled preamplifiers. It is designed to operate with either biased or non-biased VIGO detectors. AIP is „all-in-one” device – a preamplifier is integrated with a fan and a thermoelectric cooler controller in a compact housing. It is very convenient and user-friendly device, thus can be easily used in a variety of applications.

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Typical value	Conditions, remarks
Low cut-off frequency f_{lo} , Hz	DC, 10, 100, 1k, 10k	
High cut-off frequency f_{hi} , Hz	100k, 1M, 10M, 100M, 250M	
Transimpedance K_p , V/A	up to 200k	fixed
Output impedance R_{out} , Ω	50	
Output voltage swing V_{out} , V	$\pm 2 \pm 1$	$f_{hi} \leq 1 \text{ MHz}, R_L = 1 \text{ M}\Omega$ $f_{hi} > 1 \text{ MHz}, R_L = 50 \Omega$)
Output voltage offset V_{off} , mV	max ± 20 **)	
Power supply voltage V_{sup} , V	+5 +12	with 2TE and 3TE cooled detectors with 4TE cooled detectors
Power supply current I_{sup} , mA	max ± 50	
Ambient operating temperature T_a , $^\circ\text{C}$	10 to 30	
Signal output socket	SMA	RF output
DC output socket	SMA	DC monitor
Supply socket	DC 2.1/5.5 DC 2.5/5.5	$V_{sup} = +12 \text{ V}$ $V_{sup} = +5 \text{ V}$
Mounting hole	M4	
Fan	yes	

) R_L – load resistance

***) Measured with equivalent resistor at the input instead of the detector, it is to avoid the environmental thermal radiation impact.

Features

- › Integrated TEC controller and fan
- › Frequency bandwidth up to 250 MHz
- › Single power supply
- › DC monitor
- › Optimised for effective heat dissipation
- › Compatible with optical accessories
- › Cost effective OEM version available
- › Universal and flexible

Types of VIGO detectors that can be integrated with AIP preamplifier

- › **Photoconductive**
PC-2TE, PC-3TE, PC-4TE
- › **Photoconductive optically immersed**
PCI-2TE, PCI-3TE, PCI-4TE
- › **Photovoltaic**
PV-2TE, PVA-2TE, PV-3TE, PV-4TE
- › **Photovoltaic optically immersed**
PVI-2TE, PVIA-2TE, PVI-3TE, PVI-4TE
- › **Photovoltaic multiple junction**
PVM-2TE
- › **Photovoltaic multiple junction optically immersed**
PVMI-2TE, PVMI-3TE, PVMI-4TE

Code description

Type		f_{lo} , Hz		f_{hi} , Hz	Version
AIP	-	DC	-	100	S (with package)
		10		1M	
		100		10M	
		1k		100M

Included accessories

- › 2x **SMA-BNC** cables + **AC adaptor**

Dedicated accessories

- › **OTA** optical threaded adapter
- › **DRB-2** base mounting system

PIP series

PIP is a series of programmable “smart” preamplifiers. Due to the modern internal configuration, it offers extreme flexibility combined with superior signal parameters and high reliability. Built-in voltage monitor allows to check and optimize the working conditions (supply voltages, detector bias voltage, first and last stage output voltage offset etc.).

There is also possible to change the gain, coupling (AC/DC), optimize the first stage transimpedance and manually or automatically suppress the voltage offset. Optimized parameters are stored into the internal EEPROM memory and automatically loaded after the power is on. Reset to default settings is available at any time. For detection module safety detector bias adjusting is blocked by default. User can request to enable this option while ordering.

For proper operation PTCC-01 TEC controller is required.

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Typical value	Conditions, remarks
Low cut-off frequency f_{lo} , Hz	DC/10	user configurable by software
High cut-off frequency f_{hi} , Hz	150k/1.5M/20M 1.5M/15M/200M	user configurable by software
Transimpedance K_t , V/A	"2.5k – 150k 0.5k – 30k"	"digitally adjustable first stage transimpedance = 1 k Ω first stage transimpedance = 5 k Ω "
Output impedance R_{out} , Ω	50	
Output voltage swing V_{out} , V	± 1	$R_L = 50 \Omega$ ¹⁾
Output voltage offset V_{off} , mV	max ± 20 ²⁾	
Ambient operating temperature T_a , $^\circ\text{C}$	10 to 30	
Signal output socket	SMA	
Power supply and TEC control socket	LEMO (female)	ECG.0B.309.CLN
Mounting hole	M4

FIP series

FIP is a series of high speed, transimpedance, AC coupled preamplifiers, intended to operate with biased TE cooled VIGO detectors. Fast preamplifier enables precise I-V conversion, detector biasing up to 800 mV and simultaneously maintains compact size and keeps current noise low. FIP is equipped with a fan and does not require additional heat dissipation. It is suitable for applications requiring wide frequency bandwidth. Additional DC output is available as an option.

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Typical value	Conditions, remarks
Low cut-off frequency f_{lo} , Hz	1k, 10k	
High cut-off frequency f_{hi} , Hz	1G

SIP series

SIP is a series of ultra-small transimpedance, AC or DC coupled preamplifiers. It is designed to operate with either biased or non biased detectors. It is compatible with uncooled detectors in TO39 package (SIP-TO39) or thermoelectrically cooled detectors in TO8 package (SIP-TO8). SIP is dedicated for OEM applications and requires external heatsink (MHS-2). There is a possibility to adjust gain (devices with a frequency bandwidth up to 100 MHz).

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Typical value	Conditions, remarks
Low cut-off frequency f_{lo} , Hz	DC, 10, 100, 1k, 10k

DRB-2 base mounting system

DRB-2 is a stable base mounting system dedicated for VIGO detection modules with M4 mounting hole and VIGO uncooled detectors in BNC and PEM-SMA packages. DRB-2 has adjustable height and is compatible with M6 optical breadboards.

BP is a base plate made of black, lacquered steel. It provides mechanical stable conditions for mounting system. Weight: 1756 g.

MP is a mounting post made of stainless steel. It is equipped with two thread adapters TA-4-6. Weight: 115 g.

PH is a post holder made of black anodized aluminium. It is equipped with wing knob WK-4. Weight: 60 g.

DRB-2 consists of

- › base plate **BP**
- › mounting post **MP**
- › post holder **PH**

Mechanical layout, mm,

Base plate BP

Thread adapter M4-M6

Mounting post MP

Post holder PH

MHS-2 heatsink

MHS-2 is an external heatsink made of black anodized aluminium, dedicated for OEM VIGO detection modules integrated with TE cooled detectors and preamplifier SIP-TO8. It provides suitable dissipation of heat generated by the Peltier cooler. Its thermal resistance is ~ 1.5 K/W.

Mechanical layout, mm,

DH-2 detector holder

DH-2 is a detector holder with M4 mounting hole, dedicated for assembly VIGO uncooled detectors in BNC and PEM-SMA packages. It is compatible with DRB-2 mounting system.

Mechanical layout, mm

MH-1 module holder

MH-1 is a module holder with M4 mounting hole, dedicated for assembly VIGO microM-10.6 detection modules. It is compatible with DRB-2 mounting system.

Mechanical layout, mm

OTA optical threaded adapter

OTA is an optical threaded adapter made of black anodized aluminium. It is an accessory which allows to build complex systems containing VIGO detection modules (AIP, MIP, PIP) and optical components.

OTA is compatible with all types Thorlabs SMI threaded lens tubes.

GLOSSARY AND TECHNICAL INFORMATION

Glossary

Infrared detectors

Infrared photodetectors are semiconductor electro-optical devices that convert infrared radiation into an electrical signal.

Photoconductive detectors PC

Photoconductive detectors based on the photoconductive effect. Infrared radiation generates charge carriers in the semiconductor active region decreasing its resistance. The resistance change is sensed as a current change by applying a constant voltage bias. The devices are characterized by near linear current-voltage characteristics. The electric field E in photoconductors is constant across the device. It equals ratio of bias voltage V_b and distance between contacts L :

$$E = \frac{V_b}{L}$$

The optimum bias voltage is specified in the Final test report (supplied with each VIGO device) and depends on detector size, operating temperature and spectral response.

Photovoltaic detectors PV, PVM

Photovoltaic detectors (photodiodes) are semiconductor structures with one (PV) or multiple (PVM), homo- or heterojunctions. Absorbed photons produce charge carriers that are collected at the contacts, resulting in external photocurrent. Photodiodes have complex current voltage characteristics. The devices can operate either at flicker-free zero bias or with reverse voltage. Reverse bias voltage is frequently applied to increase responsivity, differential resistance, improve high frequency performance and increase the dynamic range. Unfortunately, at the expense of flicker noise $1/f$ in most cases.

Photovoltaic detectors are more vulnerable to electrostatic discharges than photoconductors.

Photoelectromagnetic detectors PEM

Photovoltaic detectors are based on the photoelectromagnetic effect based on spatial separation of optically generated electrons and holes in the magnetic field. The devices do not require electrical bias and show no flicker noise $1/f$. The PEM devices are typically used as fast, uncooled detectors of the long wavelength radiation.

Active element material $Hg_{1-x}Cd_xTe$

$Hg_{1-x}Cd_xTe$ also known as Mercury Cadmium Telluride, MCT, $HgCdTe$, $(Cd, Hg)Te$ or MerCardTel. It is a variable band gap alloy, commonly used for fabrication of photodetectors with tunable spectral response.

Active element material $InAs_{1-x}Sb_x$

$InAs_{1-x}Sb_x$ also known as Indium Arsenide Antimonide or $InAsSb$ is another variable band gap alloy used for fabrication of photodetectors with tunable spectral response.

Active area A , mm×mm

The physical area of a photosensitive element, the active region that converts incoming optical radiation into electric output signal.

$$A = W \text{ (width)} \times L \text{ (length)}.$$

In photoconductors L is a distance between contacts

Optical area A_o , mm×mm

The apparent optical area of the detector which is “seen”. It is equal to physical area of the detector active element unless an optical concentrator is used. The optical detector area can be significantly magnified in detectors supplied with optical concentrators, i.e. immersion microlenses. For more information please see chapter *Optical immersion technology*.

$$A_o = W_o \text{ (width)} \times L_o \text{ (length)}.$$

Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm

The shorter wavelength at which a detector responsivity reaches 10% of the peak value.

Peak wavelength λ_{peak} , μm

The wavelength of detector maximum responsivity.

Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm

The longer wavelength at which a detector responsivity reaches 10% of the peak value.

Normalized detectivity D^* , $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$

The signal-to-noise ratio (SNR) at a detector output normalized to 1 W radiant power, a 1 cm^2 detector optical area and a 1 Hz noise bandwidth.

Noise equivalent power NEP, $\text{nW}/\text{Hz}^{1/2}$

The incident power on the detector generating a signal output equal to the 1 Hz bandwidth noise output. Stated another way, the NEP is the signal level that produces a signal-to-noise ratio (SNR) of 1.

Photocurrent I_{ph}

Photocurrent is the current generated by infrared radiation, which is not in thermal equilibrium with detector. For small irradiation, the photocurrent is proportional to incident radiation power P.

$$I_{\text{ph}} = R_i \cdot P$$

R_i is the current responsivity.

Current responsivity R_i , A/W

Current responsivity is the ratio of photocurrent and power of radiation. The current responsivity is typically measured for monochromatic radiation (the spectral current responsivity) and blackbody radiation (the blackbody current responsivity). The responsivity typically remains constant for weak radiation and tends to decrease with more strong radiation.

Current responsivity-active area length product $R_i \cdot L$ and current responsivity-optical area length product $R_i \cdot L_o$, $\text{A}\cdot\text{mm}/\text{W}$

The current responsivity of unbiased PEM, PVM and biased (with constant electric field E) PC detectors is proportional to the reciprocal active area length L (optical area length L_o). Therefore, the current responsivity $R_i \cdot L$ ($R_i \cdot L_o$) is used to compare devices of various formats.

Another normalized current responsivity, $R_i \cdot L/E$ ($R_i \cdot L_o/E$), is used to compare responsivity of photoconductive detectors of various format, and operating with different electric fields

Time constant τ , ns

Typically, detector time response can be described by the one pole filter characteristics. Time constant is the time it takes detector to reach $1/e \approx 37\%$ of the initial signal value. The time constant is related to the 3dB high cut-off frequency f_{hi} :

$$\tau = 1/(2\pi \cdot f_{\text{hi}})$$

Time constant for one pole filter is related to 10-90% rise time t_r :

$$t_r = 2.2 \cdot \tau$$

Bias voltage-active area length ratio V_b/L , V/mm

Normalized photoconductive bias voltage for nonimmersed detectors.

Bias voltage-optical area length ratio V_b/L_o , V/mm

Normalized photoconductive bias voltage for immersed detectors.

Flicker noise $1/f$

It is a frequency dependent noise. It occurs in any biased devices.

$1/f$ noise corner frequency f_c , Hz

Frequency, at which the low frequency noise equals to the white noise (e.g. the Johnson or shot noise), the flicker noise dominates at $f < f_c$.

Resistance-active area product $R \cdot A$, $\Omega \cdot \text{cm}^2$

Normalized detector resistance for nonimmersed photovoltaic detectors. It is used to compare photodiodes with different sizes of active areas, in which dynamic resistance decreases proportionally to the detector active area.

Resistance-optical area product $R \cdot A_o$, $\Omega \cdot \text{cm}^2$

Normalized detector resistance for immersed photovoltaic detectors. It is used to compare photodiodes with different sizes of optical areas, in which dynamic resistance decreases proportionally to the detector optical area.

Active element temperature T_{det} , K

The detector active element temperature.

Acceptance angle Φ , deg

Acceptance angle is the maximum cone angle at which incoming radiation can be captured by a detector. Radiation coming from a larger angle will not reach the detector. In systems without external objectives, acceptance angle and field of view (FOV) are identical.

Infrared detection modules

Detection module integrates detector, preamplifier, thermoelectric cooler, and other components (detector biasing circuit, heat dissipation system, optics etc.) in a common package. The operation of detection modules can be described in similar way as for detectors, by specifying their spectral and frequency characteristics of responsivity and detectivity.

Voltage responsivity R_v , V/W

The output voltage divided by optical power incident on the detector. For spectra measurements it can be expressed as:

$$R_v(\lambda) = R_i(\lambda) \cdot K_i$$

Low cut-off frequency f_{lo} , Hz

The minimum frequency at which a detection module gain reaches -3dB of the peak value or 0 for DC coupling devices.

High cut-off frequency f_{hi} , Hz

The maximum frequency at which a detection module gain reaches -3dB of the peak value. f_{hi} of the preamplifier may differ from f_{hi} of the detection module.

Noise measurement frequency f_0 , Hz

Frequency at which output voltage noise density is measured selectively.

Transimpedance K_i , V/A

Current to voltage conversion ratio:

$$K_i = \frac{V_{out}}{I_{in}}$$

Current signal I_{in} , A

Current signal from photodetector when exposed to incident radiant power.

Output noise voltage density v_n , nV/Hz^{1/2}

Noise voltage density measured at preamplifier output.

Output impedance R_{out} , Ω

Impedance that appears in series with the output from an ideal amplifier.

Load resistance R_L , Ω

Resistance of the detection module's load.

Output voltage V_{out} , V

Output signal of the detection module.

Output voltage offset V_{off} , mV

Output DC voltage of the detection module without input signal.

Power supply input $+V_{sup}$ and $-V_{sup}$, V

Supply voltage required for correct detection module operation.

Power supply current I_{sup} , mA

Supply current consumption during correct detection module operation.

GND

Point of zero potential. It is common power supply ground and signal ground.

Ambient operating temperature T_a , °C

Ambient temperature during test measurements.

Thermoelectric coolers and thermoelectric cooler controllers

Active element temperature T_{det} , K

The detector active element temperature.

Maximum thermoelectric cooler current I_{max} , A

Maximum current resulting in greatest ΔT_{max} .

Maximum thermoelectric cooler voltage V_{max} , V

Maximum voltage drop resulting in greatest ΔT_{max} . Maximum heat pumping capacity Q_{max} , W

Q_{max} rated at $\Delta T = 0$. At other ΔT cooling capacity should be estimated as $Q = Q_{max} \cdot (1 - \Delta T / \Delta T_{Tmax})$.

Maximum temperature difference ΔT_{max} , K

ΔT_{max} rated at $Q = 0$. At other Q the temperature difference should be estimated as $\Delta T = \Delta T_{max} \cdot (1 - Q / Q_{max})$.

Temperature stability, K

It indicates the possible error in the temperature on the thermoelectric cooler.

Temperature readout stability, mK

It indicates the possible error in readout of the temperature of the thermoelectric cooler provided by controller.

Detector temperature settling time, s

The time taken by the cooling system to reach appropriate temperature of the detector active element.

Maximum TEC output current, A

Maximum current that is provided by the controller to the thermoelectric cooler.

Output voltage range, V

Range of voltage on output of module.

Power supply voltage V_{sup} , VDC

Supply voltage required for correct thermoelectric cooler controller operation.

Power supply current I_{sup} , mA

Supply current required for correct thermoelectric cooler controller operation.

Series resistance of the connecting cable, Ω

Material parameter. It is resistance of the supply cable. It depends on the cable length.

Detector's packages and infrared windows

	Package type	Cooling	Window	Detector type
	BNC	uncooled	no	PC, PCI, PV, PVI, PVM, PVMI
	TO39	uncooled	no	PC, PCI, PV, PVI, PVA, PVIA, PVM, PVMI
	PEM-SMA	uncooled	yes	PEM, PEMI
	PEM-TO8	uncooled	yes	PEM, PEMI
	TO8	uncooled	no	PCQ, PVMQ
	TO8	TE cooled	yes	PC-2TE, PC-3TE, PC-4TE PCI-2TE, PCI-3TE, PCI-4TE PV-2TE, PVA-2TE, PV-3TE, PV-4TE PVI-2TE, PVIA-2TE, PVI-3TE, PVI-4TE PVM-2TE PVM-2TE, PVM-3TE, PVM-4TE
	TO66	TE cooled	yes	PC-2TE, PC-3TE, PC-4TE PCI-2TE, PCI-3TE, PCI-4TE PV-2TE, PVA-2TE, PV-3TE, PV-4TE PVI-2TE, PVIA-2TE, PVI-3TE, PVI-4TE PVM-2TE PVM-2TE, PVM-3TE, PVM-4TE

Uncooled detectors are typically provided in BNC or TO39 packages without the window.

The exception are the specialized PEM packages. Due to magnetic circuit incorporated into the package, 3° wedged zinc selenide anti reflection coated (wZnSeAR) window is supplied to protect against external pollution. There are two versions of packages dedicated for photoelectromagnetic detectors:

- › PEM-SMA with SMA signal output connector which makes it convenient in use,
- › PEM-TO8 on TO8 header which enables integration with VIGO preamplifier

Encapsulation

Thermoelectrically cooled detectors are mounted in metal packages: TO8 and TO66 sealed with IR windows. The packages are filled with dry, heavy, noble gases (Krypton / Xenone mixture) of low thermal conductivity. Water vapor condensation is prevented by humidity absorber container mounted inside the package and careful polymer sealing. For low temperature fluctuation anti-convection shields is also apply.

Infrared windows

We provide two types windows as a standard:

- › 3° wedged sapphire (wAl_2O_3)
- › 3° wedged zinc selenide anti-reflection coated (wZnSeAR)

3° wedge prevents „fringing” – unwanted interference effects.

Material	Hardness, kg/mm ²	Wedging	Anti-reflection coating	Symbol
sapphire	1370	3°	no	wAl_2O_3
zinc selenide	120	3°	yes	wZnSeAR

Spectral transmission of wAl_2O_3 and wZnSeAR windows (typical example)

Thermoelectric cooling

Some of VIGO devices are provided with thermoelectric cooling. Cooling of infrared detectors reduces noises, increases responsivity, shifts the cut-off wavelength toward longer wavelengths (in HgCdTe detectors) and toward shorter wavelengths (in InAs / InAsSb detectors).

Two-, three- and four-stage thermoelectric coolers are available. Operation of TE coolers is based on Peltier effect. Thermoelectric coolers are supplied with DC power supply.

Temperature control

Thermoelectrically cooled detectors are equipped with built-in thermistor to provide precise control an measurements of detector active element temperature.

The electricity applied to between terminals of thermistors should be under the maximum power dissipation at 25°C (100 mW) not to destroy the thermosensor. For the measurement of resistance, the power should not exceed 1 mW.

The relation between the resistance and the temperature:

$$R_T = R_{T_0} \exp\left(\beta \cdot \frac{T_0 - T}{T \cdot T_0}\right)$$

$R_{T_0} = 2.2 \text{ k}\Omega \pm 3\%$ at $T_0 = 298 \text{ K}$

$\beta = 3500 \text{ K} \pm 1$

Resistance vs. temperature of thermistor

T, K	T, °C	R _{min} , k	R _{nom} , k	R _{max} , k

298	25	2.13	2.20	2.27

Heat sinking

Suitable heat sinking is necessary to dissipate heat generated by the Peltier cooler or excessive optical irradiation. Since heat is almost 100% dissipated at the base of the detector header, it must be firmly attached to the heat sink.

A thin layer of heat conductive epoxy or silicon (thermal) grease should be used to improve thermal contact between the detector header and the heat sink to maximize heat transfer. Heat sinking via the detector cylindrical cap or via the mounting screw is not sufficient.

A heatsink thermal resistance of ~ 2 K/W is typically recommended for the most 2TE and 3TE coolers. For 4TE cooler, heatsink thermal resistance ~ 1 K/W is recommended.

Correct heatsink placement

Incorrect heatsink placement

Optical immersion technology

In order to improve performance and get the best signal-to-noise ratio of the devices, optical immersion technology may be applied. It is successfully use in all types VIGO detectors.

Optical immersion it is monolithic integration of detector active element with hyperhemispherical microlens (default). It makes optical linear size of detector active area $|l|$ times larger compared to its physical size. This results in improvement of detectivity D^* by one order of magnitude. Also detector electric capacitance C_d is reduced by a factor of two orders of magnitude compared to conventional detector of the same optical area. Acceptance angle is reduced to $\sim 36^\circ$ – the microlens naturally shields background radiation which is one of the factors of noise. Hemispherical microlens is available as a custom option.

Optical power limitations for optically immersed detectors are more restrictive than for detectors without immersion microlens – for more information please see chapter Precautions for use.

Optically immersed detectors parameters

Parameter	Microlens shape			
	Hemisphere ^{*)}		Hyperhemisphere	
	Theory	GaAs	Theory	GaAs
Distance L	R	R	$R \cdot (n+1)$	$4.3 \cdot R$
d / d'	n	3.3	n^2	10.9
$D^*_{imm} / D^*_{non-imm}$	n	3.3	n^2	10.9
Acceptance angle Φ	180°	180°	$2\arcsin(1/n)$	$\sim 36^\circ$

^{*)} Custom option

n – refractive index of microlens material (GaAs), $n = 3.3$

d – optical (apparent) detector size

d' – physical detector size

R – lens radius

L – lens face to objective focal plane distance

h – lens thickness, $h = R + R/n$

Function and properties of hemisphere microlens

Precautions for use

Operating temperature

A detector should be operated at its optimal temperature given in the Final test report (delivered with every device).

Maximum voltage

Do not operate the photovoltaic detector at higher bias voltages than suggested in the Final test report (delivered with every device).

Be careful using ohmmeters for photovoltaic detectors!

Standard ohmmeters may overbias and damage the detector. This is especially true for small physical area or SWIR photovoltaic detectors. Bias of 10 mV can be used for resistance measurements of any type of detector. Ask for conditions of I-V plot measurements!

Usage

Devices can operate in the 10% to 80 % humidity, in the -20°C to $+30^{\circ}\text{C}$ ambient temperature range. Operation at $>30^{\circ}\text{C}$ ambient may reduce performance for standard Peltier coolers.

Ask for devices that can operate in the $+30^{\circ}\text{C}$ to $+80^{\circ}\text{C}$ ambient temperature range.

Storage

The following conditions should be fulfilled for safe and reliable operation of detector:

- › store in dark place, 10% to 90% humidity and -20°C to $+50^{\circ}\text{C}$ temperature,
- › avoid exposing to the direct sunlight and strong UV/VIS light as this may result in degradation of the detector performance,
- › avoid electrostatic discharges at leads therefore, the devices should be stored having leads shorted.

Beam power limitations

Damage thresholds, specified as integrated power of incoming radiation:

- › For devices without immersion microlens irradiated with continuous wave (CW) or single pulses of more than $1\ \mu\text{s}$ duration, irradiated power on the active area must not exceed $100\ \text{W}/\text{cm}^2$. The irradiance of a pulse shorter than $1\ \mu\text{s}$ must not exceed $1\ \text{MW}/\text{cm}^2$.
- › For optically immersed detectors irradiated with CW or single pulse longer than $1\ \mu\text{s}$ irradiance on the apparent optical active area must not exceed $2.5\ \text{W}/\text{cm}^2$. The irradiance of the pulse shorter than $1\ \mu\text{s}$ must not exceed $10\ \text{kW}/\text{cm}^2$.

- › For repeated irradiation with pulses shorter than $1\ \mu\text{s}$, the equivalent CW irradiation, average power over the pulse-to-pulse period should be less than the CW damage threshold according to equation:

$$\text{equivalent CW radiation power density} = \frac{\text{pulse peak power}}{\text{focus area}} \cdot \text{pulse duration} \cdot \text{repetition rate}$$

Saturation thresholds vary by detector type and can be provided upon request.

Handling

Particular attention should be paid to not scratch a surface of the window. A damaged window may entirely degrade the detector performance. Excessive mechanical stress applied to the package itself or to a device containing the package may result in permanent damage. Peltier element inside thermoelectrically cooled detectors is susceptible to mechanical shocks. Great care should be taken when handling cooled detectors.

Cleaning window

Keep the window clean. Use a soft cotton cloth damped with isopropyl alcohol and wipe off the surface gently if necessary.

Mechanical shocks

The Peltier elements may be damaged by excessive mechanical shock or vibration. Care is recommended during manipulations and normal use. Drop impacts against a hard surface are particularly dangerous.

Shaping leads

Avoid bending the leads at a distance less than 2 mm from a base of the package to prevent glass seal damage. When shaping the leads, maximum two right angle bends and three twists at the distance minimum 6 mm from the base of the package.

Keep the leads of the detecting element shorted when shaping!

Soldering leads

IR detectors can be easily damaged by excessive heat. Special care should be taken when soldering the leads. Usage of heat sinks is highly recommended. Tweezers can be used for this purpose; when soldering, clamp a lead at a place between the soldering iron and the base of the package. To avoid destructive influence of ESD and other accidental voltages (e.g. from a non-grounded soldering iron) rules for handling LSI integrated circuits should be applied to IR detectors too. Leads should be soldered at $+370^{\circ}\text{C}$ or below within 5 s.
